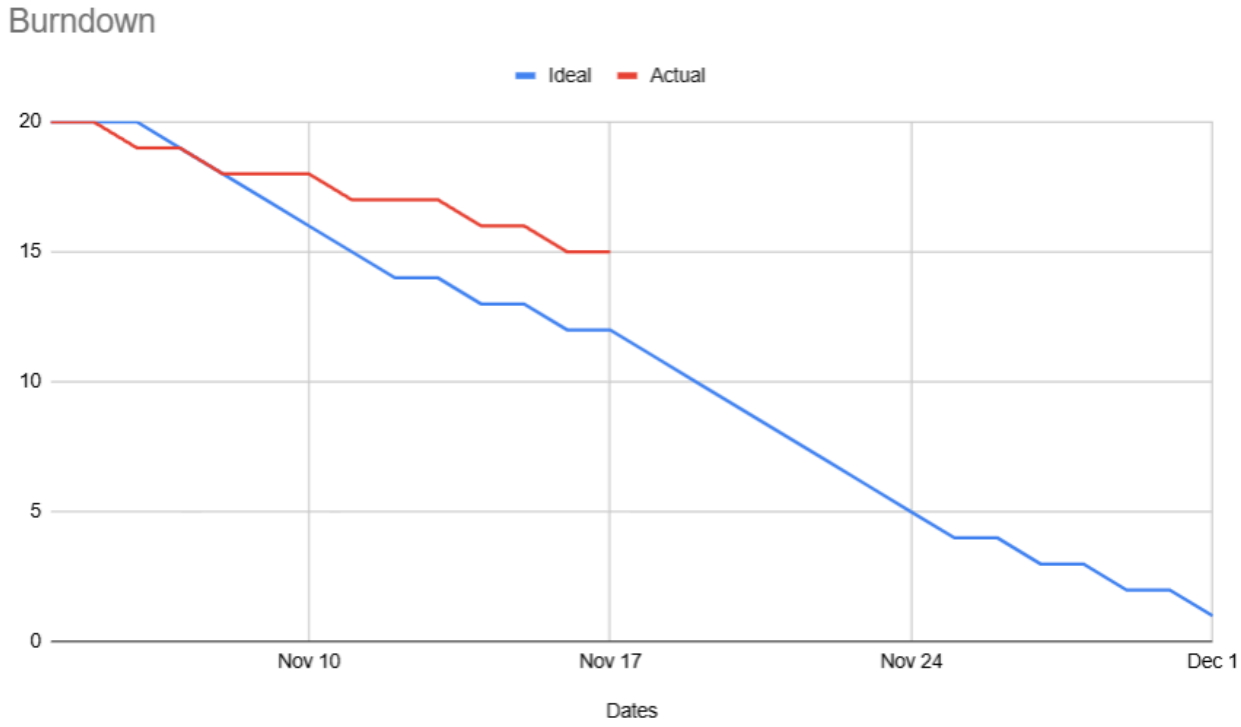
Burndown



Planned Velocity

The initial setup of the environment and coordinating the backend is expected to take ideally 3 days. In this time, other features cannot be worked on.

Overall, the Trello points we are looking to implement are shorter tasks that we expect to get through within a day to 2. This would include features like displaying balances, setting savings goals, and freezing accounts. Features that require processing backend data and linking multiple account data together is expected to take over 3 days but not more than 5.

Sprint Velocity

The sprint velocity has gone according to the initial setup however more time was taken to get the frontend and backend to communicate. This has lead to portions of 2-3 days to achieve features such as login and checking balance.
